

Using the blockchain to create a another path of trust.

User 1 & User 2 trusting each other, with User A as trust intermediary.

Trust managed by mydigitalstructure is replicated to a private or public blockchain depending on the nature of the information.

User 1 & 2 can then read the blockchain (ie User 2 could check if User 1 is certified).

Or manage status changes ie User 2 updates that audit complete. Or user 2 could be a *thing* sending machine state. mydigitalstructure as User B could then consume that information from the blockchain and update it.
